Patient & Customer Information:

Patient: Bobby Kowalski	Practice: Sample Neurology Practice	Performing Technician: Will Herman
Date of Birth: 01/01/1946 Age: 74	Ordering Provider: James Glover, MD	Tests Ordered: CTSIB, Tymp, OAE, ABR, AHR, VNG, Calorics
Gender: Male	Date of Service: 03/11/2020	Date Report Completed: 03/17/2020

Patient Medical History:

Mr. Kowalski presents for vestibular and equilibrium evaluation due to symptoms of lightheadedness lasting hours and falls. Provocation of symptoms occurs when standing up. His symptoms reportedly began one year ago, and have been persistent since onset. Concomitant symptoms include visual changes. Medical history is remarkable for hypertension, hypercholesterolemia, Diabetes, and depression.

Testing Interpretations:

Peripheral Findings: Abnormal auditory brainstem response (ABR) and otoacoustic emissions suggest hearing loss.

Central Findings: Abnormal ocular motility testing is suggestive of central nervous system involvement. Report of vertigo with no nystagmus in both Dix-Hallpike positions and abnormal modified CTSIB is likely consistent.

Other: No other findings present.

Recommendations:

Correlate suggested central nervous system involvement with any other evaluations you have performed, like imaging, if deemed necessary by you. Consider audiology referral for further evaluation and management of possible hearing loss.

Diagnostic Testing Impressions:

All indicative results and analysis should be considered in the context of subject case history, symptoms, diagnosis, medications, treatment plans and therapies. Final diagnosis is the sole responsibility of the licensed medical practitioner after patient examination, lab tests, and/or clinical findings as necessary. Vestibular results template was designed with permission from Dr. Robert Allen, Au.D and Brent Jones, CEO of Topple Diagnostics.
